Object Oriented Modeling and Programming in Engineering

Homework 1

Bauhaus-Universität Weimar

TEACHER:

Mathias Artus

SUBMITTED BY:

Cesar Fernando Gamba Tiusaba Registration number 127138 1. From an oscillating energy system, you've got the equation for the power:

$$P(t) = a_1 * t + \sin(2 * \pi * f_1 * t)$$

Whereat:

$$a_1 = \frac{127138}{40000} W$$
$$f_1 = 2 Hz$$

For this system you want to calculate the energy consumption E(t) for t=20 seconds.

$$E(t) = \int_0^t p(t) \cdot dt$$

$$P(t) = \frac{127138}{40000} \cdot t + \sin(2 \cdot \pi \cdot 2 \cdot t)$$

$$E(t) = \int_0^{20} \left(\frac{127138}{40000} \cdot t + \sin(2 \cdot \pi \cdot 2 \cdot t)\right) \cdot dt$$

$$E(t) = \int_0^{20} \left(\frac{63569}{20000} \cdot t + \sin(4 \cdot \pi \cdot t)\right) \cdot dt$$

$$E(t) = \left(\frac{63569 \cdot t^2}{40000} - \frac{\cos(4 \cdot t \cdot \pi)}{4 \cdot \pi}\right) \Big|_0^{20}$$

$$E(t) = \left(\frac{63569 \cdot 20^2}{40000} - \frac{\cos(4 \cdot 20 \cdot \pi)}{4 \cdot \pi}\right) - \left(\frac{63569 \cdot 0^2}{40000} - \frac{\cos(4 \cdot 0 \cdot \pi)}{4 \cdot \pi}\right)$$

$$E(t) = \left(\frac{63569}{100} - \frac{1}{4 \cdot \pi}\right) - \left(-\frac{1}{4 \cdot \pi}\right)$$

$$E(t) = \left(\frac{63569}{100}\right) = 635.69$$

2. UML Diagram

The UML diagram presented in the Figure 1 is used to show and explain the class *MainClass_Homework1* and the methods used to calculate and graph the area of the function using 3 different numerical methods and the analytical function, the class. The C# is called MainClass_Homework1.

The UML diagram presented in the Figure 2 is used to show and explain the class *TestFunction*, this class is used to test the class *MainClass_Homework1*
